

Summary

Saskatchewan produces gold from SSR Mining Inc.'s Seabee Gold operation (Seabee) located about 125 kilometres northeast of La Ronge. Seabee transports feed from the Santoy mine some 12 kilometres to the Seabee mill for processing. The operation has produced over 2 million ounces of gold since opening in 1991. The province's most prolific gold producer remains Saskatchewan's part of the Flin Flon copper-zinc mine, which produced about 3.6 million ounces of by-product gold. The rise in gold prices is attracting increased exploration interest to the province. Prospective areas include the Goldfields area southeast of Uranium City, the La Ronge gold belt, the area surrounding Seabee, and the Flin Flon – Creighton region.

Deposit Type

Gold mineralization is dominated by orogenic gold deposits, which are hosted in fault zones in Saskatchewan's Canadian Shield. Many of the known deposits extend to surface and have never been explored to depth. There is also potential for other styles of mineralization, such as gold associated with volcanogenic massive sulfide base metal deposits in the Flin Flon - Creighton area.

Competitive Development Incentives

Saskatchewan continues to rank as one of the world's most attractive jurisdictions for mining investment, according to the Fraser Institute's Annual Survey of Mining Companies. Saskatchewan has a rich history of gold production and possesses key geological attributes conducive to hosting significant deposits, supported by proactive provincial policies that foster gold mining and exploration:

- **The Targeted Mineral Exploration Incentive** - delivers a 25 per cent rebate on eligible drilling and ground geophysical expenditures for all hard-rock minerals.
- **The Saskatchewan Mineral Exploration Tax Credit** - a 30 per cent non-refundable credit for Saskatchewan residents investing in eligible exploration flow-through shares.
- **Crown Royalty Structure** - one of Canada's most competitive royalty systems for gold and other metals featuring a 10-year royalty holiday for new mines.

Gold Potential

Geology

Goldfields

The Box and Athona deposits produced over 65,000 oz of gold and have a combined Mineral Resource of ~1 M oz remaining.

La Ronge Area

This area has seen past production of ~650,000 oz of gold from multiple orogenic gold deposits since 1985.

La Ronge Gold Project

Operations were suspended at the Roy Lloyd, EP and Komis mines in 2014. Combined, they produced 77,118 oz of gold @ 8.55 g/t.

Seabee Gold Operation

Over 2.1 M oz of gold have been produced from this operation since 1991, with operations ongoing today.

Flin Flon

Flin Flon Mining District

Over 3.6 M oz of by-product gold have been produced from zinc-copper mining over the past century.

Contact Lake Mine

Between 1994 and 1998, the Contact Lake mine recovered 188,185 oz of gold. The area has recently seen renewed drilling.
