The Right Kind of Warming: Modern Line Heaters for a Resilient Natural Gas System

SaskEnergy is modernizing key parts of its system by upgrading equipment to be more energy efficient. One of the ways the corporation does this is through the replacement of older line heaters with newer models designed to use far less energy. These heaters warm natural gas so it can move safely and reliably through the network. The shift to updated line heater equipment has continued across Saskatchewan, with higher efficiency heaters now installed at more than 200 stations to support steady operations and reduce energy use.

Why It Matters

Modernizing critical equipment helps keep natural gas service dependable. More efficient heaters lower energy use and improve emissions intensity, demonstrating the sector's commitment to responsible, steady service for Saskatchewan communities.
