Winds of Progress: Building a More Resilient Power System

Saskatchewan's wind energy sector is growing, contributing steadily to the province's diverse mix of electricity sources.

In 2024, a major boost came from the new Bekevar Wind Energy Facility. Its addition helped increase renewable capacity by 200 megawatts, raising the total from 617 megawatts in 2023 to 817 megawatts in 2024.

This growth in renewable capacity supports SaskPower's larger supply mix, which as of December 31, 2025, includes 2,113 megawatts of renewable generation, about 34.2 per cent of the province's available generating capacity.

Why It Matters

SaskPower's wind energy contributes to a diverse and dependable electricity system that can adjust as weather, demand and system conditions change. This reflects a practical approach to long-term resilience, ensuring that communities across the province continue to have reliable, affordable power while reducing the overall emissions intensity of power generation.
