

# Crop Report

For the Period September 14 to 20, 2021

Published by the Ministry of Agriculture  
ISSN 0701 7085  
Report number 21, September 23, 2021

Relatively warm, dry conditions this week allowed farmers to make good harvest progress. Farmers with crop still in the field are hoping for these conditions to continue until harvest is complete, while farmers who have completed harvest are hoping for rain to rejuvenate topsoil and subsoil moisture before winter.

Eighty-nine per cent of the crop is currently in the bin, up from 74 per cent last week, and well ahead of the five-year (2016-2020) average of 63 per cent for this time of year. An additional seven per cent of the crop is swathed or ready to straight-cut, this is mostly canola and flax waiting to be harvested.

Harvest is most advanced in the southwest region, where 94 per cent of the crop is now combined. The southeast region has 92 per cent combined and the west-central 89 per cent. The east-central region has 84 per cent combined, the

northeast 90 per cent and the northwest 77 per cent.

## Saskatchewan Harvest September 20, 2021 Per cent Combined

Winter wheat	100
Fall rye*	100
Spring wheat	94
Durum	97
Oats*	100
Barley*	99
Canaryseed	85
Flax	64
Canola	80
Mustard	96
Soybeans	78
Lentils	99
Peas	99
Chickpeas	93

\*includes 10 per cent 'other'

Ninety-nine per cent of the lentils, 99 per cent of the field peas, 97 per cent of the durum, 89 per cent of the barley, 94 per cent of the spring wheat, 93 per cent of the chickpeas, 80 per cent of the oats, 80 per cent of the canola and 64 per cent of the flax has now been combined. An additional 15 per cent of the canola is swathed or ready to straight-cut.

Many areas of the province did not receive rainfall this past week; the most rainfall received was 10 mm in the Macklin area. Other parts of the province received small amounts of rain ranging between 1 mm to 5 mm, which will do very little to maintain or replenish the topsoil moisture.

## One year ago

Many areas of the province received rainfall this week, particularly in parts of the western and northern regions. The Tyner area received the most with 99 mm

Seventy-seven per cent of the 2020 crop had been harvested. The majority of pastures were rated as being in poor-to-fair condition.

Agri-Food Canada

**SCIC**  
SASKATCHEWAN CROP  
INSURANCE CORPORATION

**Saskatchewan**

Provincial cropland topsoil moisture is rated as 25 per cent adequate, 46 per cent short and 29 per cent very short. Hay and pasture land topsoil moisture is rated as 16 per cent adequate, 40 per cent short and 44 per cent very short. These conditions have declined across the province due to strong winds and a lack of rain.

The majority of crop damage this week was due to wind, frost, waterfowl, wildlife and lack of moisture. We would like to remind producers that Saskatchewan Crop Insurance Corporation (SCIC) provides compensation for damage caused by wildlife through the Wildlife Damage Compensation Program; you do not need to be an existing Crop Insurance customer to file a claim. If you do experience wildlife damage, please report it immediately by visiting the SCIC website or calling 1-888-935-0000.

Pasture conditions are rated as seven per cent good, 29 per cent fair, 41 per cent poor and 23 per cent very poor. Conditions vary across the province, with the southeast and east central regions in fair-to-good condition due to recent rainfall that helped rejuvenate pasture grass.

Farmers are busy wrapping up harvest, hauling bales, moving cattle, hauling water and post-harvest field activities such as herbicide application. Several reports indicate that farmers are holding off planting winter cereals due to low topsoil moisture.

With harvest underway in Saskatchewan, we want to remind producers to exercise caution and remain safe.

**Southeastern Saskatchewan:**

- Crop District 1 – Carnduff, Estevan, Redvers, Moosomin and Kipling areas
- Crop District 2 – Weyburn, Milestone, Moose Jaw, Regina and Qu'Appelle areas
- Crop District 3ASE – Radville, Minton and Lake Alma areas

Minimal rainfall and warm day-time temperatures allowed for great harvest progress to be made. Ninety-two per cent of the crop is now in the bin, up from 81 per cent last week and remaining well ahead of the five-year (2016-2020) average for this time of year of 74 per cent. An additional four per cent of the crop is swathed or ready to straight-cut.

There was very little rainfall in the region again this week. The Weyburn area received the highest amount with 3 mm. The Frobisher, Kisbey and Radville areas received 2 mm.

Another week of no significant precipitation has further depleted topsoil moisture conditions. Cropland topsoil moisture is rated as 34 per cent adequate, 53 per cent short and 13 per cent very short. Hay and pasture land topsoil moisture is rated as 24 per cent adequate, 27 per cent short and 49 per cent very short. Farmers are hoping for rain to help improve moisture reserves for next spring.

The majority of crop damage this past week was due to wind, frost and lack of moisture. There was also damage caused by wildlife and waterfowl. Most crops have avoided damage due to frost by already being harvested, but some of the later maturing crops such as corn and soybeans have seen some damage. Farmers are hoping that the frost will kill off the regrowth in their fields and save them from having to spray.

Pasture conditions are rated as 21 per cent good, 24 per cent fair, 37 per cent poor and 18 per cent very poor. Rainfall late in the season allowed for some pastures to green up and improve their ability to support cattle grazing; now they are beginning to dry down again and more rain will be needed before winter to help the grass recover.

Farmers are busy combining, harrowing, spraying, hauling bales and grain and moving cattle.

**Southwestern Saskatchewan:**

- Crop District 3ASW – Coronach, Assiniboia and Ogema areas
- Crop District 3AN – Gravelbourg, Mossbank, Mortlach and Central Butte areas
- Crop District 3B – Kyle, Swift Current, Shaunavon and Ponteix areas
- Crop District 4 – Consul, Maple Creek and Leader areas

Good harvest progress continued to be made in the region, with many farmers starting to finish up harvest for the year. Ninety-four per cent of the crop is now combined, up from 85 per cent last week and remaining well ahead of the five-year (2016-2020) average of 79 per cent. An additional two per cent of the crop is swathed or ready to straight-cut.

Very little rainfall was received throughout the region this past week. The Shaunavon, Consul and Admiral areas all received 3 mm. This region has suffered from extreme drought during the entire 2021 growing season and is in desperate need of rainfall to replenish topsoil moisture.

Cropland topsoil moisture is rated as 11 per cent adequate, 42 per cent short and 47 per cent very short. Hay and pasture land topsoil moisture is rated as five per cent adequate, 46 per cent short and 49 per cent very short.

The majority of crop damage this past week was due to wind, frost and lack of moisture. With most of the crop off now in the region, a significant rain would be welcome.

Pasture conditions are rated as one per cent good, 24 per cent fair, 45 per cent poor and 30 per cent very poor.

Farmers are busy combining, harrowing, hauling bales, moving cattle and starting to plan their fall activities. Many farmers in the region have indicated that it is too dry to plant winter cereals this year.

#### **East-Central Saskatchewan:**

- Crop District 5 – Melville, Yorkton, Cupar, Kamsack, Foam Lake, Preeceville and Kelvington areas
- Crop District 6A – Lumsden, Craik, Watrous and Clavet areas

Favourable harvesting weather has allowed producers to make great progress in the region. Eighty-four per cent of the crop is now combined, up from 63 per cent last week and remaining ahead of the five-year (2016-2020) average of 54 per cent. An additional 11 per cent of the crop is swathed or ready to straight-cut.

Most of the east-central region did not receive rain this past week. Kenaston received the most with 2 mm and the Kuroki and Holdfast areas received 1 mm. Minimal rainfall is desired as harvest wraps up but producers in the region would like to see it rain more before winter.

Crop, hay and pasture land soil moisture continues to deplete. Cropland topsoil moisture is rated as 32 per cent adequate, 37 per cent short and 31 per cent very short. Hay and pasture land topsoil moisture is rated as 23 per cent adequate, 39 per cent short and 38 per cent very short.

The majority of crop damage this past week was due to wind, light frost and waterfowl.

Pasture conditions are rated as eleven per cent good, 33 per cent fair, 24 per cent poor and 32 per cent very poor. Dry conditions have limited pasture growth in the region and rain is required to improve moisture conditions for next year.

Farmers are busy combining, harrowing, drying grain and moving cattle.

**West-Central Saskatchewan:**

- Crop District 6B – Hanley, Outlook, Loreburn, Saskatoon and Arelee areas
- Crop District 7A – Rosetown, Kindersley, Eston and Major areas
- Crop District 7B – Kerrobert, Macklin, Wilkie and Biggar areas

Eighty-nine per cent of the crop is now combined, up from 79 per cent last week and remaining well ahead of the five-year (2016-2020) average of 62 per cent. An additional four per cent of the crop is swathed or ready to straight-cut. Good progress was made throughout last week, due to very few delays from rain or morning dew. Much of the crop left to be combined is canola and flax. Regrowth in canola has complicated harvest and farmers must wait for it to dry down before harvesting.

There was not much precipitation received this past week across the region. The Macklin area received the most with 10 mm, the Phippen area 5 mm, the Sonningdale area 4 mm, the Biggar and Smiley areas 2 mm. Once harvest is complete a large rainfall is needed throughout the region to recover the severe moisture deficit.

Rainfall in the region this past week has done little to improve topsoil moisture conditions. Cropland topsoil moisture is rated as 16 per cent adequate, 52 per cent short and 32 per cent very short. Hay and pasture land topsoil moisture is rated as eight per cent adequate, 52 per cent short and 40 per cent very short.

The main cause of crop damage this past week was hard frost, wind and lack of moisture. There were some reports of damage caused by waterfowl. There was also lodging reported in areas that received strong winds.

Pasture conditions are rated as 25 per cent fair, 45 per cent poor and 30 per cent very poor.

Farmers are busy combining, baling straw, hauling bales, harrowing, spraying regrowth and hauling water for cattle.

**Northeastern Saskatchewan:**

- Crop District 8 – Hudson Bay, Tisdale, Melfort, Carrot River, Humboldt, Kinistino, Cudworth and Aberdeen areas
- Crop District 9AE – Prince Albert, Choiceland and Paddockwood areas

Farmers were able to get a lot of their fields combined this past week and some are completely done. Ninety per cent of the crop is now combined, up from 69 per cent last week and remaining well ahead of the five-year (2016-2020) average of 44 per cent. An additional nine per cent of the crop is swathed or ready to straight-cut. Farmers are hoping for warm, dry weather to progress crop maturity and dry down, especially on canola regrowth.

Very little rainfall fell throughout the region this past week. The Garrick and Arborfield areas received 3 mm while the Bruno and Melfort areas received 2 mm. This rain will do very little for the topsoil moisture and did not cause long delays in harvest.

Moisture conditions have continued to decline this week. Cropland topsoil moisture is rated as 35 per cent adequate, 64 per cent short and one per cent very short. Hay and pasture land topsoil moisture is rated as 22 per cent adequate, 72 per cent short and six per cent very short.

The majority of crop damage this past week was due to wind, frost and waterfowl.

Pasture conditions are rated as one per cent good, 51 per cent fair, 46 per cent poor and two per cent very poor. Pastures in this region are in desperate need of moisture to help them recover from the severe drought that they have suffered since the spring.

Farmers are busy swathing, combining, drying grain and hauling bales.

#### **Northwestern Saskatchewan:**

- Crop District 9AW – Shellbrook, North Battleford, Big River and Hafford areas
- Crop District 9B – Meadow Lake, Turtleford, Pierceland, Maidstone and Lloydminster areas

Combines were rolling in the region for most of the week, but there were some rain delays for some farmers. Seventy-seven per cent of the crop is now combined, up from 57 per cent last week and now ahead of the five-year (2016-2020) average of 35 per cent. An additional 16 per cent of the crop is swathed or ready to straight-cut. For the most part the crop is coming off dry but for some producers it is tough or damp and must be put into aeration bins or grain dryers. Warm, dry weather is desired to mature and dry down crops.

There was no significant rainfall throughout the region but several areas received light rain showers that were enough to interrupt harvest. The Barthel and St. Walburg areas received the most with 8 mm, the North Battleford area 7 mm, the Meadow Lake and Turtleford areas 4 mm and the Neilburg area 2 mm. This precipitation will not change the topsoil moisture and another more significant widespread rain is needed to help recharge the ground water.

Moisture conditions reduced slightly in the region this past week. Cropland topsoil moisture is rated as 26 per cent adequate, 33 per cent short and 41 per cent very short. Hay and pasture land topsoil moisture is rated as 19 per cent adequate, 28 per cent short and 53 per cent very short.

The majority of crop damage this past week was due to wind, frost, waterfowl, and wildlife. Farmers have noted green regrowth is making harvest difficult but hope the frost will cause the regrowth to die down.

Pasture conditions are rated as three per cent good, 25 per cent fair, 48 per cent poor and 24 per cent very poor.

Farmers are busy combining, swathing, grain drying and moving bales.

**Municipality No: A, B, C and D - more than one reporter**

These precipitation amounts represent point locations within each municipality and do not necessarily reflect the whole R. M.

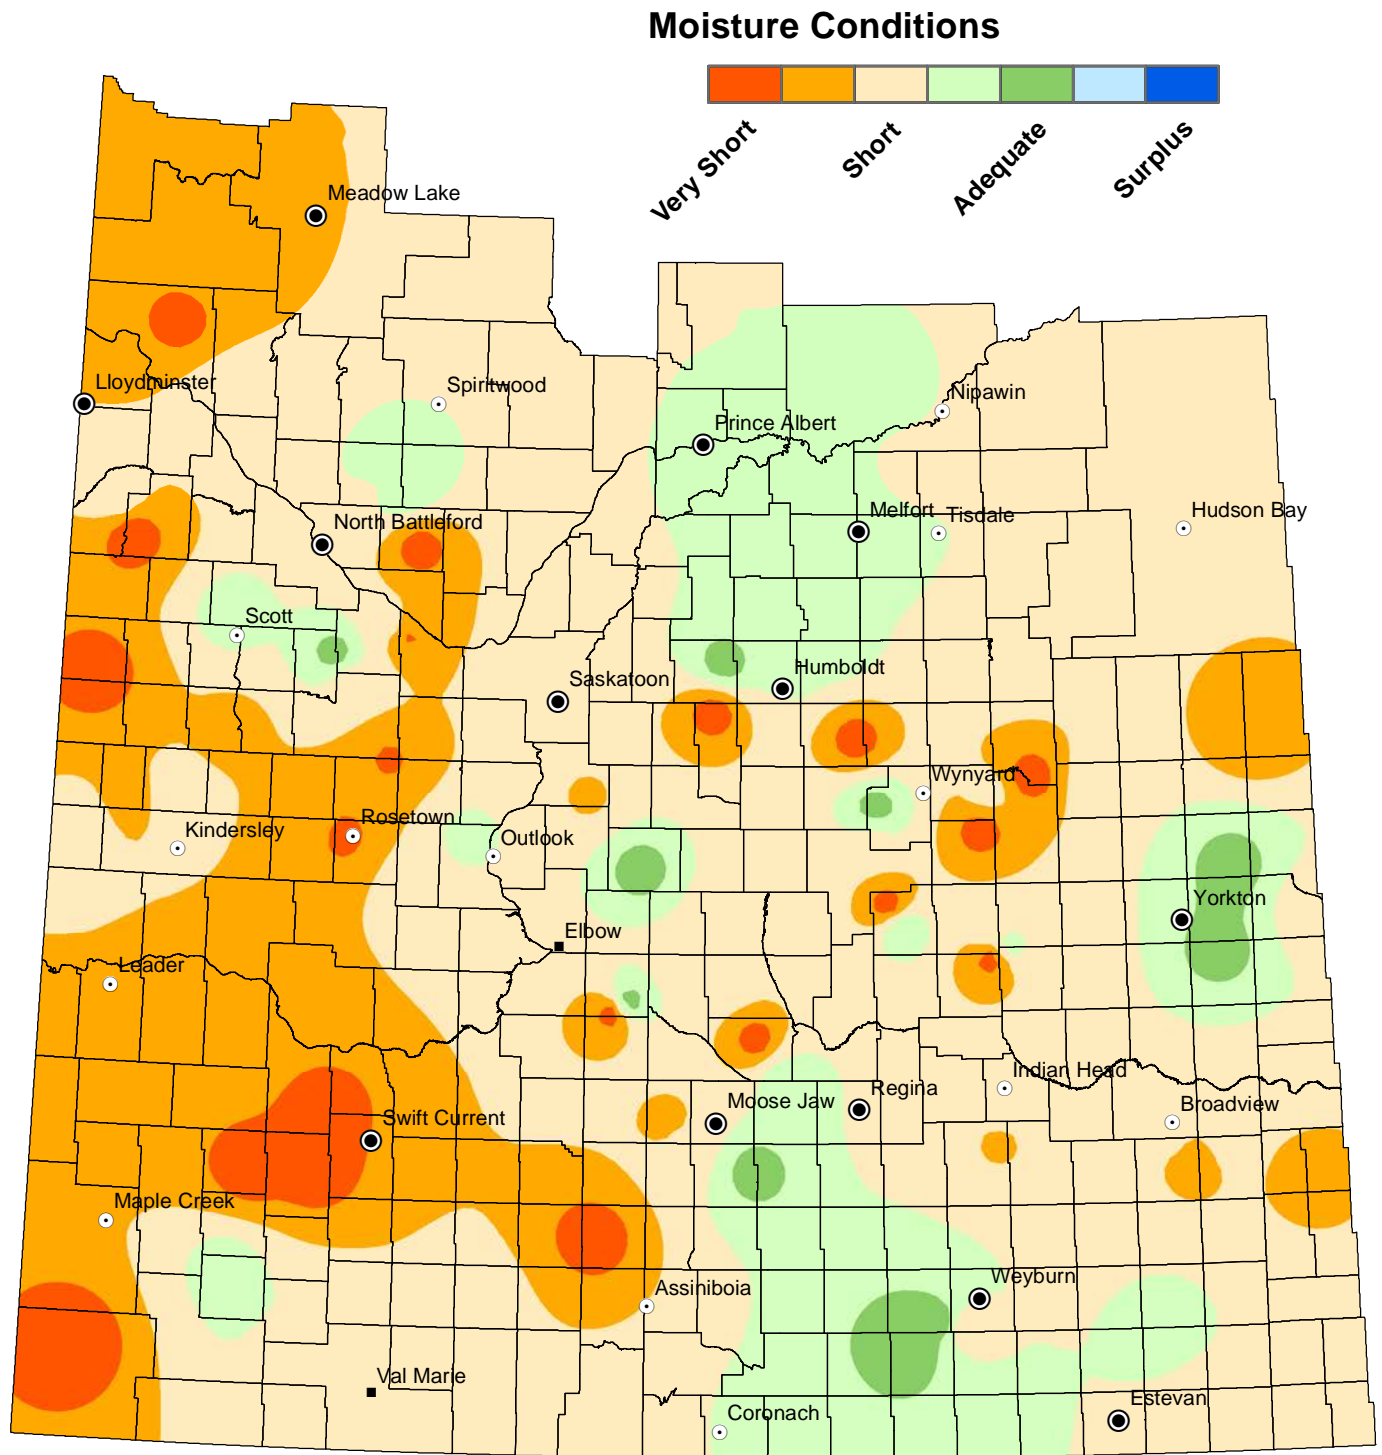

# Cumulative Rainfall

from April 1 to September 20, 2021

# Cropland Topsoil Moisture Conditions

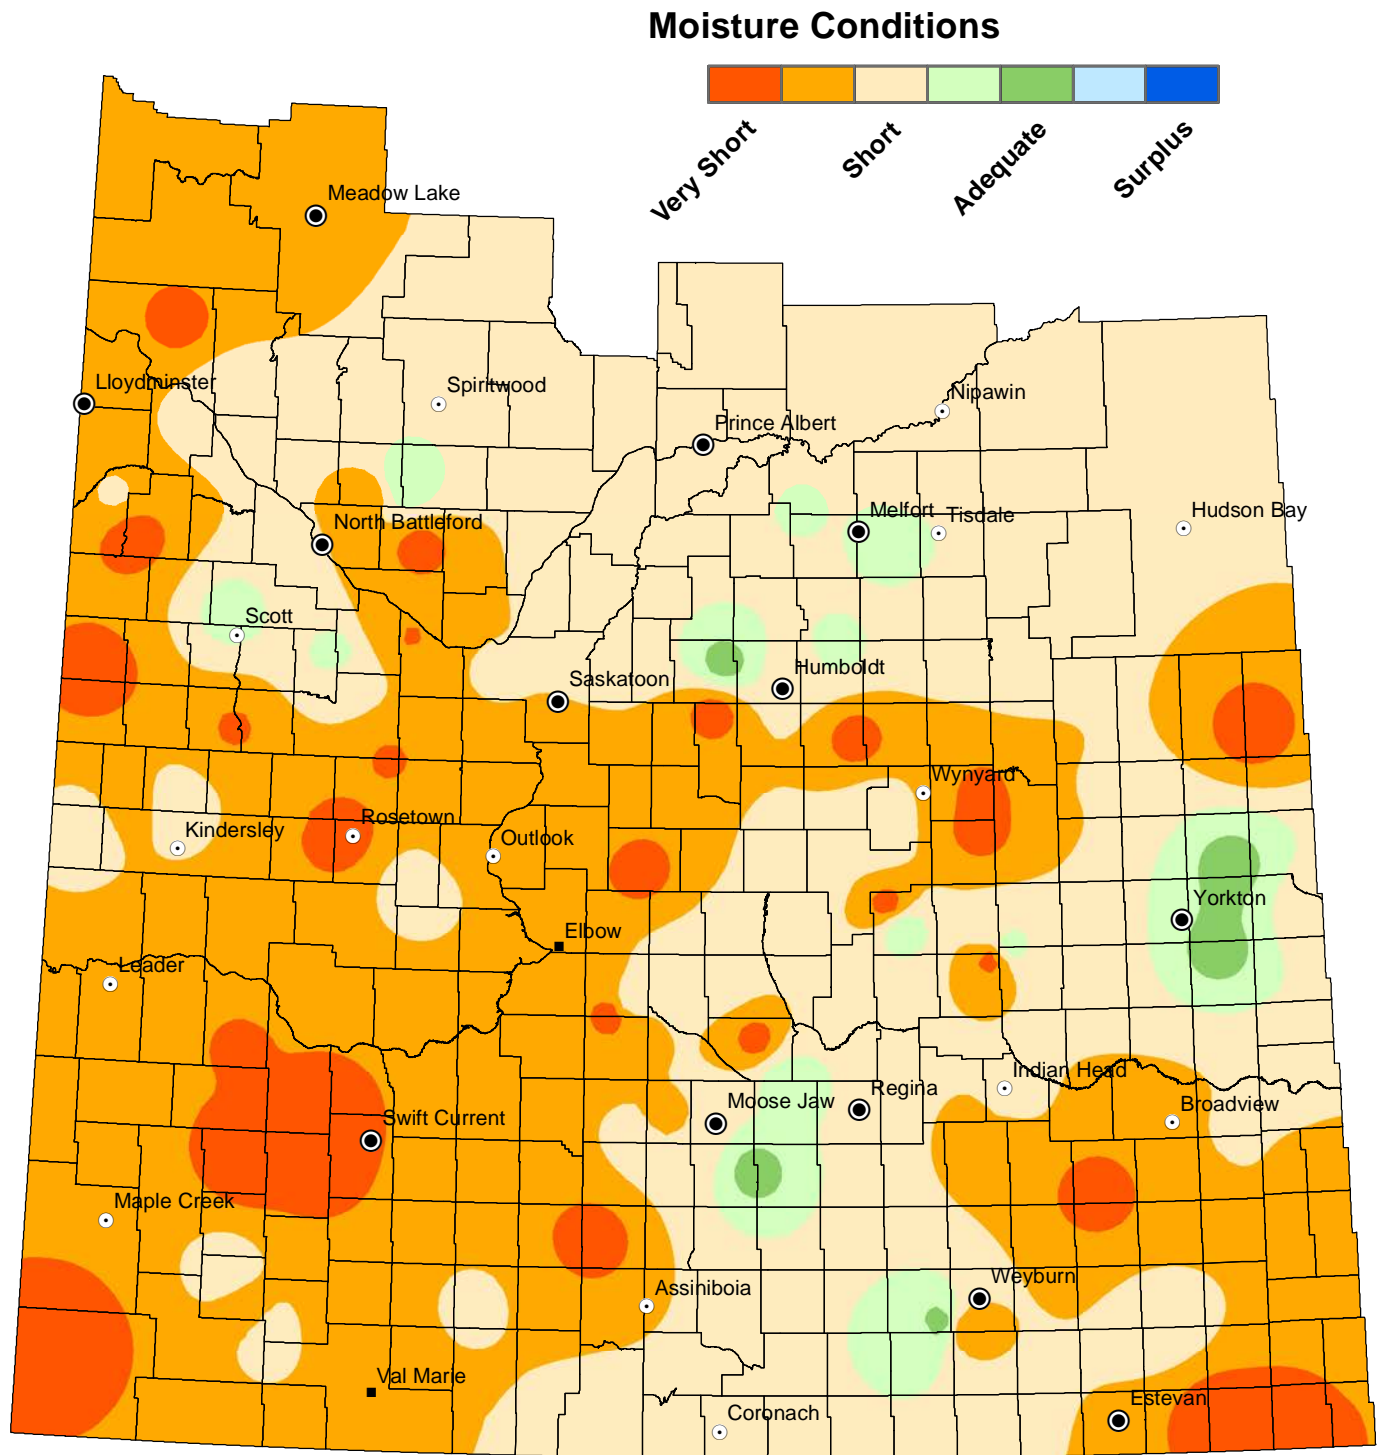

September 20, 2021

NOTE: Since techniques used to smooth the transition between zones can affect the values in localized areas, this map should be used for regional analysis only.

# Hay and Pasture Topsoil Moisture Conditions

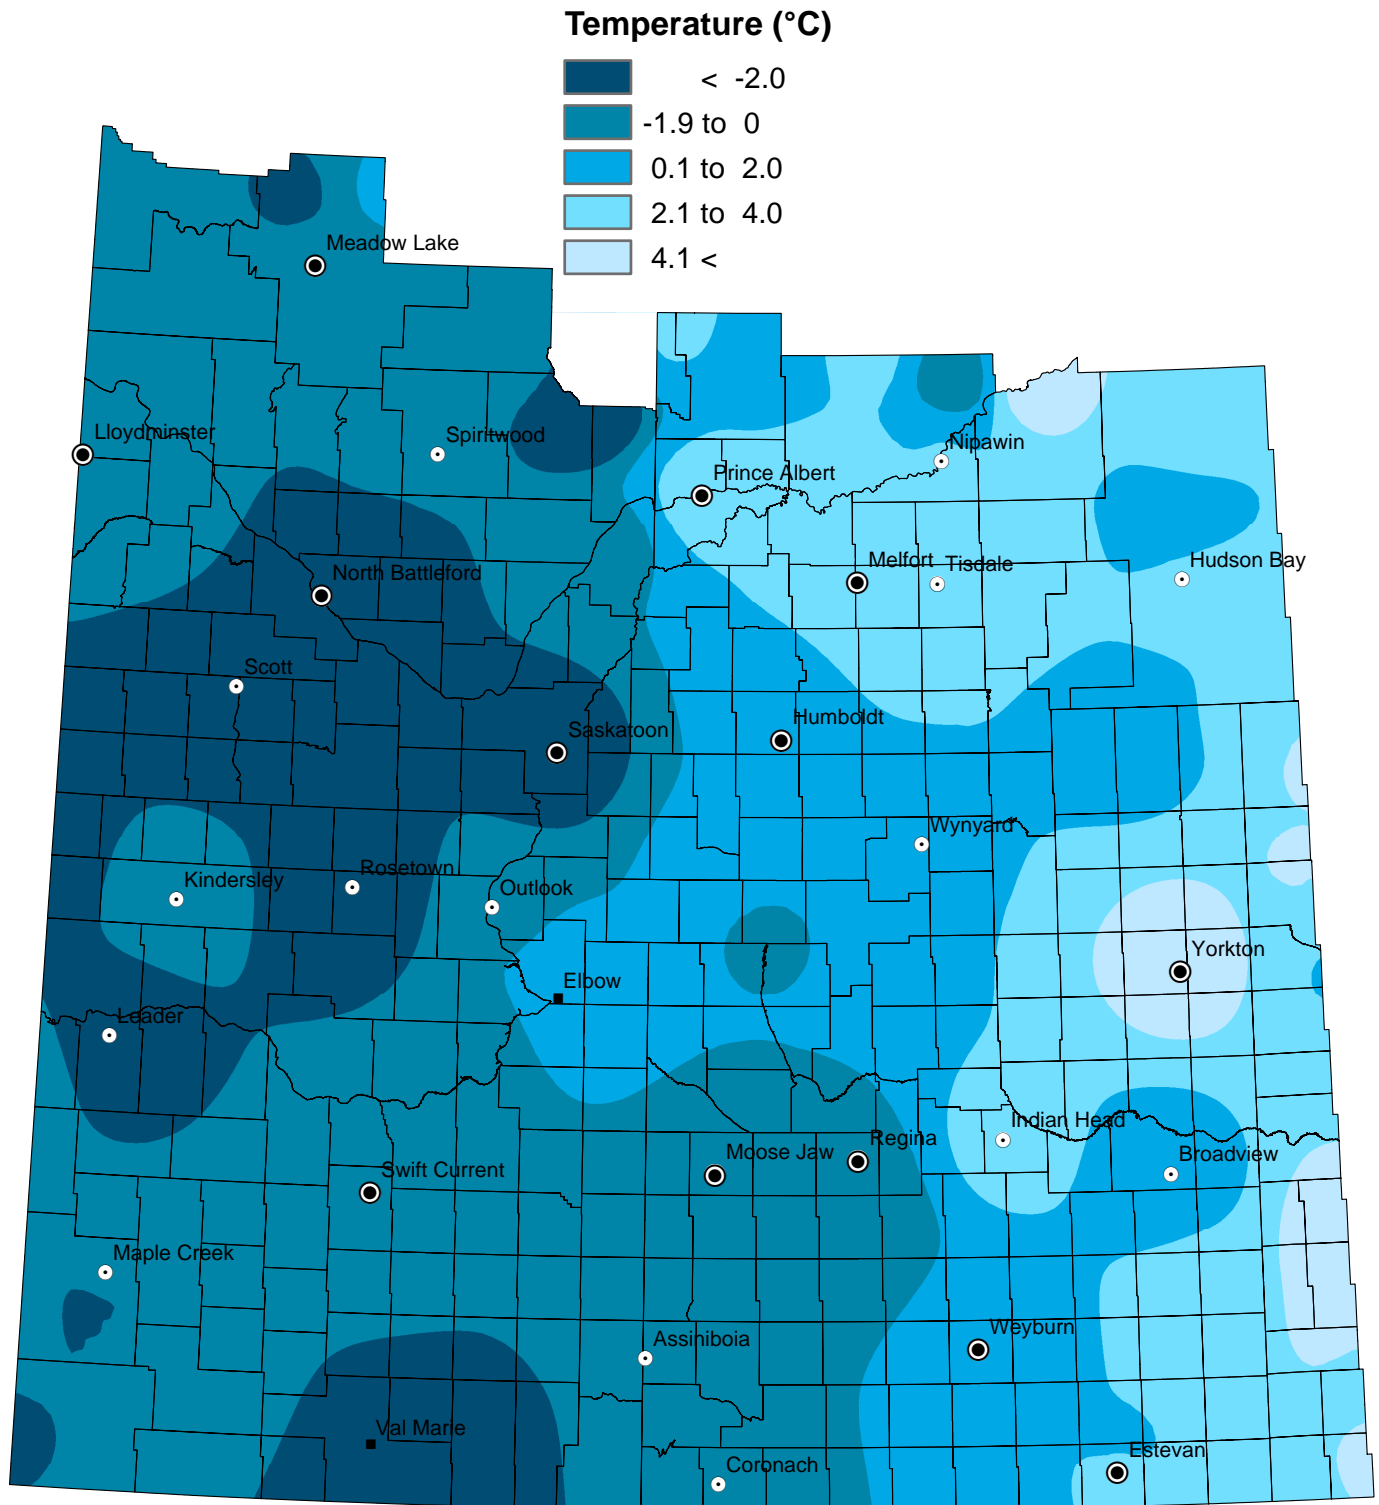

## September 20, 2021

NOTE: Since techniques used to smooth the transition between zones can affect the values in localized areas, this map should be used for regional analysis only.

# Minimum Temperature

from September 14 to September 20, 2021

NOTE: Since techniques used to smooth the transition between zones can affect the values in localized areas, this map should be used for regional analysis only.

# Maximum Temperature

from September 14 to September 20, 2021
